Chapter 1: Introduction

This specific work concerns an information system for a cinema page where a visitor to the page can view the available movies. They can also request the creation of an account, which needs to be approved by an administrator. The user of the page can also view the movies and book tickets for them by selecting the number of tickets and a screening. The system administrator can add users, approve, edit, and delete users, as well as perform the same actions for movies, screenings, and reservations. This system is implemented using PHP, JavaScript, CSS, and SQL.

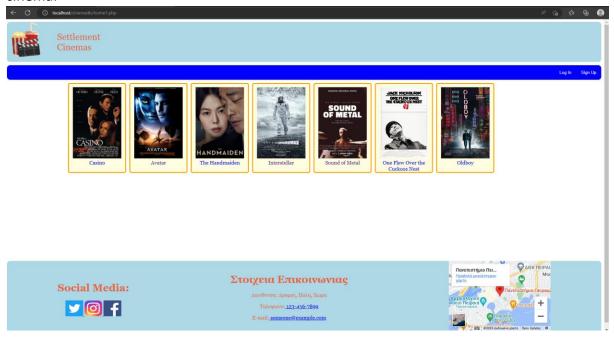

Chapter 2: Description of the Implemented System

For this particular work, a network-centric information system was developed that satisfies the requested requirements. Specifically, it is a cinema system where the following can be done:

- 1) User registration: A user can sign up, and after an admin reviews their request, they can log in to the page. Before that, they can only browse movies and view information about them.
- **2)** System user management: Once there are users and requests from users, the admin can access admin.php and manage these users. More specifically, they can a) approve requests for account creation, b) update user information, and c) delete a user.
- **3)** Management of structural elements of the system: The admin has access to all the elements offered to users and created by them (reservations). Specifically, they can create and delete movies, create and delete screenings, and edit all of these.
- **4)** Browsing products: A regular user can view the movies available at the cinema without being logged in and click on them for more information about the movie.
- **5)** Product reservation: A logged-in user, i.e., someone approved by the admin, can book tickets for a movie, creating a reservation for that movie. The admin can also view all reservations.

Chapter 3: System Implementation

Initially, a user is on home1.php. There they can see the movies currently available at the cinema.

The movies are displayed as follows: an SQL statement is executed and passed to \$result, and through a while loop using fetch_array, each row of \$result is passed to \$row, representing a row of the specific table from the database. Then, the movie images are displayed in a specific way based on the movie_name (for this reason, the image names in the images folder should be the same as in the database). Additionally, through href=movie_desc?id=\$row['movie_id'], we are redirected to the specific PHP file with the movie's code passed in the URL.

Movie Monitoring

After being redirected to movie_desc.php, further information about the movie is available.

The way the movie ID is obtained for the movie we have clicked on is through the GET operation. Thus, an SQL statement is executed to retrieve the information for the specific movie we clicked on.

Additionally, there is a button labeled "Go back" that takes you back to home1.php. The same button exists in other PHP files to log out, but it redirects to log_out.php (which will be shown below).

Sign Up

In home1.php, a visitor has the option to sign up.

By clicking this button, a Modal will appear with a form where they can enter their details.

The Country and Cities fields have available values displayed in dropdown list boxes through an API. Depending on the selected country, the available cities for that country are provided by the API. (Note: The implementation of this specific API may have a different number of cities for each country, resulting in varying numbers of cities displayed for each country.) Specifically, for the country selection, a function in the script.js file runs, displaying the countries, and then populating the options in the cities dropdown box.

```
<label for="countries"><b>Country:</b></label>
<select onmouseup="showCities();" class="text" name="user_country" id="countries" ></select>
<br>
<br>
<br>
<br>
<label for="cities"><b>City:</b></label>
<select class="text" name="user_city" id="cities"></select>
```

```
//+++++++
    Rest API για τις χωρες
const xhttp2 = new XMLHttpRequest();
const select2 = document.getElementById("countries");
const flag = document.getElementById("flag");

let countries;

xhttp2.onreadystatechange = function(){
    console.log('this.status', this.status);
    if (this.readyState == 4 && this.status == 200){
        countries = JSON.parse(xhttp2.responseText);
        assignValues2();
        //handleCountryChange();
    }
};
```

```
function showCities(){
    const xhttp = new XMLHttpRequest();
    const select = document.getElementById("cities");
    const selectedCountry = document.getElementById("countries").value;

let cities;

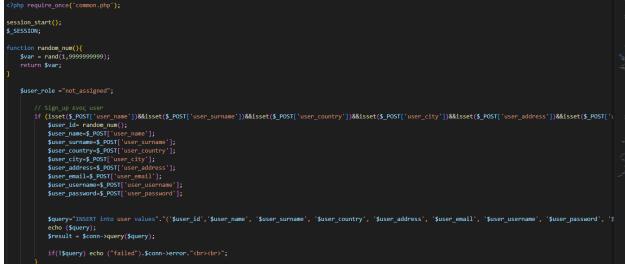

xhttp.onreadystatechange = function(){
    console.log('this.status', this.status);
    if (this.readyState = 4 && this.status ==200){
        cities = JSON.parse(xhttp.responseText);
        assignValues();
        //handleCountryChange();
    }
};

xhttp.open("GET", "https://countriesnow.space/api/v0.1/countries/population/cities", true);
xhttp.send();

select.length=0;
function assignValues(){
    cities["data"].forEach(data => {
        if(data.country=selectedCountry){
        const option = document.createElement("option");
        console.log('data', data)
        option.value = data.city;
        option.value = data.city;
        select.appendChild(option);
    }
});
```

Once all the fields in the sign-up form are filled out, an SQL statement is executed to insert the corresponding data into the user table.

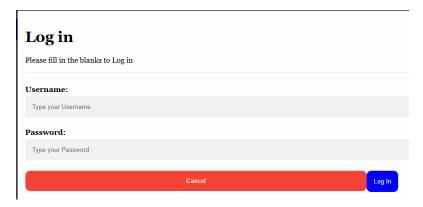

INSERT into user values('6991912249','test', 'test', 'Malaysia', 'test', 'test', 'test', 'not_assigned', 'Kuala Terengganu')

Malaysia

When a sign-up occurs, the default value for the user_role is "not_assigned." A user with this user_role cannot log in yet.

Log in

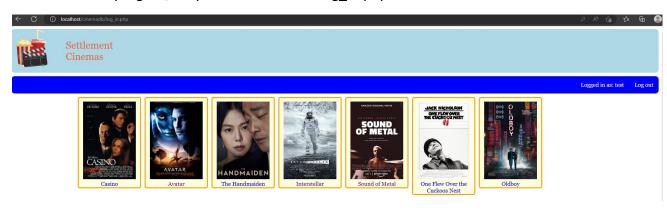

When a user's registration has been approved and the user_role has changed from "not assigned" to "User," they can log in. By clicking the log-in button, a modal form appears.

After filling in the blanks and clicking the log-in button, the entered data is stored in the "log_username" and "log_password" variables. Then, an SQL statement is executed to retrieve a user with the same user_username as the "log_username." The database is checked to see if such a record exists, and the result is stored in the "user_data" variable. Next, a check is performed to see if the "log_password" matches the user_password of that specific user in the database. If it does, a SESSION is created with the user_id. This creates a super global variable that helps determine if a user is logged in when performing functions that require being logged in, such as booking tickets.

```
session_start();
$_SESSION;
```

After a user successfully logs in, they are redirected to log in.php.

Log out

When the log-out button is pressed, we go to the log_out.php file.

There, the SESSION is terminated, preventing access to other PHP files even if they are accessed via the URL.

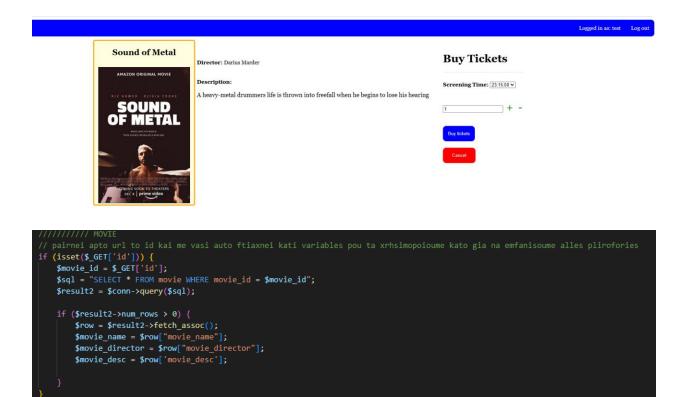

Buy tickets

When the log-in occurs, the check_login() function is executed. It checks if the user who logged in has a pre-existing SESSION. If not, they are redirected back to home1.php. Additionally, if the user_role is "not_assigned," they are redirected back to home1.php. If the user_role is "Admin," they are directed to the admin page.

```
<?php require_once('common.php');</pre>
   session_start();
   function check_login($conn){
       if(isset($_SESSION['user_id']))
           $id = $_SESSION['user_id'];
           $query = "select * from user where user_id = '$id' limit 1";
           $result = mysqli_query($conn , $query);
           if($result && mysqli_num_rows($result) > 0)
               $user_data = mysqli_fetch_assoc($result);
               return $user_data;
       header("Location: home1.php");
   $user_data = check_login($conn);
    if($user data['user role']== "not assigned")
       header("Location: home1.php");
    if($user_data['user_role'] == "Admin"){
       header("Location: admin.php");
```

If the user clicks on a movie, they are redirected to tickets.php, passing the movie_id in the URL.

There, they see the ticket purchase menu where they can select a specific screening (previously defined by the admin) and the number of tickets. An SQL statement is executed to create variables with information about the selected movie.

The way screenings are displayed:

```
<select id='screening_time' name='screening_id'>";

// Τα screening_time εμφανιζονται αναλογα το movie_id

$sql = "select * from screening where movie_id =$movie_id ";

$result3=$conn->query($sql);

if(!$result3) die($conn->error);

while($row=$result3->fetch_array(MYSQLI_ASSOC)){

    echo "<option value='".$row['screening_id']."'>".$row['screening_time']."</option>";
}

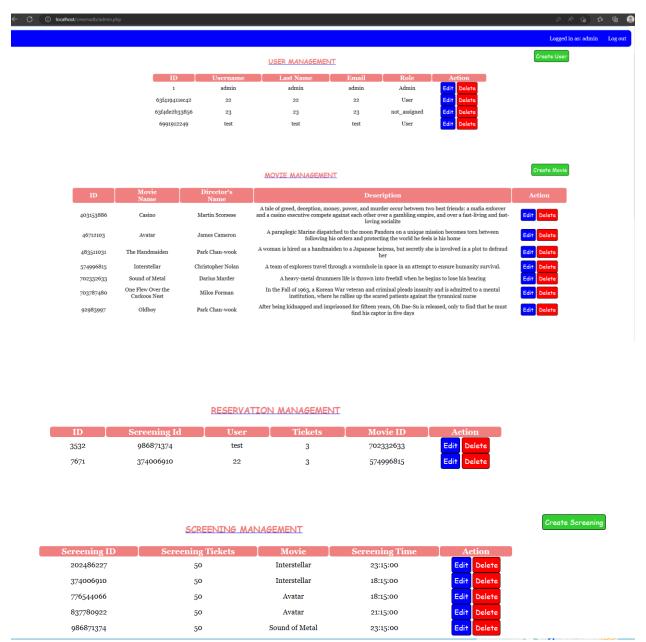

echo "</select>
```

To select the number of tickets, two objects that resemble buttons have been created, along with a script that runs when one of these two "buttons" is clicked.

```
<input type='number' id='ticketAmount' name='ticketAmount' value='1'>
<a class='button' onclick='ticketPlus();'>+</a>
<a class='button' onclick='ticketMinus();'>-</a>
<script>
function ticketMinus() {
    temp = document.getElementById('ticketAmount').value;
    if(temp>1){
    document.getElementById('ticketAmount').value = temp-1;
    temp = document.getElementById('ticketAmount').value;
    document.getElementById('ticketAmount').value = parseInt(temp)+1;
</script>
<br>
<br>
<br>
<button id='tickets_button' type='submit'>Buy tickets</button>
<button type="button" onclick="location.href='log_in.php'" class="cancelbutton">Cancel</button>
echo "
```

Admin.php

When an admin logs in, a user with user_role="Admin" is redirected to admin.php instead of log_in.php.

There, the admin can view everything related to the cinema system. They can also modify users, create new users, delete users, and perform the same actions for movies and screenings.

Create User

When the admin clicks on "Create User," a modal form appears (similar to when a user signs up).

Create User

This form has an action="admin.php," which is why the following code snippet is present in the admin.php header (similarly, we perform an insert when creating movies and screenings).

```
// o Admin κανει create καινουργιους users

if (isset($_POST['user_name'])&&isset($_POST['user_surname'])&&isset($_POST['user_city'])&&isset($_POST['user_address'])&&isset($_POST['user_address'])&&isset($_POST['user_address'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_address'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_surname'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_city'])&&isset($_POST['user_c
```

Create Movie

Create Movie

```
<a class="create" onclick="document.getElementById('id03').style.display='block'">Create Movie</a>
       <span onclick="document.getElementById('id03').style.display='none'" class="close" title="Close Modal">X</span>
       <h1>Create Movie</h1>
         <!-- Υπαρχει προβλημα σταν στο description παει να μπει κειμενο με αποστροφο ' μεσα καθως το μπερδευει το που τελειωνει το text
<label for="movie_name"><b>Movie Name:</b></label>
<input type="text" placeholder="Enter Movie's Name" name="movie_name" required>
          <label for="movie_desc"><b>Movie Description:</b></label>
          <input type="text" placeholder="Enter Movie's Description" name="movie_desc" required>
           <div class="clearfix">
             <button type="button" onclick="document.getElementById('id03').style.display='none'" class="cancelbtn">Cancel</button>
              <button type="submit" class="signup">Create Movie</button>
       if (isset($_POST['movie_name'])&&isset($_POST['movie_director'])&&isset($_POST['movie_desc'])){
            $movie_id= random_num();
            $movie_name=$_POST['movie_name'];
            $movie director=$ POST['movie director'];
            $movie_desc=$_POST['movie_desc'];
            $query="INSERT into movie values"."('$movie_id','$movie_name', '$movie_director', '$movie_desc')";
            echo ($query);
            $result = $conn->query($query);
            if(!$query) echo ("failed").$conn->error."<br>>";
```

Create Screenings

```
<a class="create" onclick="document.getElementById('id06').style.display='block'">Create Screening</a>
             <!--Screening MANAGEMENT WITH MODAL FOR CREATE MOVIE-->
<a class="create" onclick="document.getElementById('id06').style.display='block'">Create Screening</a>
                    <h1>Create Screening</h1>
                        <label for="screening_tickets"><b>Screening Tickets:</b></label>
                        <input type="text" placeholder="Screening Tickets" name="screening_tickets" required>
                        <label for="movie_id"><b>Movie Id:</b></label>
                        <!-- Εμφανιζονται οι ταινιες σε ενα dropdown menu για να επιλεξει για πιο θα δημιουργηθει το screening --> <select id='selectMovie_id' name='movie_movie_id'>
                            $sqlMovie = "select * from movie";
                            $resultMovies=$conn->query($sqlMovie);
                                if(!$resultMovies) die($conn->error);
                                   while($row=$resultMovies->fetch_array(MYSQLI_ASSOC)){
                        <label for="screening_time"><b>Screening Time:</b></label>
                        <input type="text" placeholder="Screening Time" name="screening_time" required>
                        <div class="clearfix">
                           <button type="submit" class="signup">Create</button>
                  // ο Admin κανει create καινουργια screenings
                  if (isset($_POST['screening_tickets'])&&isset($_POST['movie_movie_id'])&&isset($_POST['screening_time'])){
                      $screening_id= random_num();
                      $screening_tickets=$_POST['screening_tickets'];
$movie_movie_id=$_POST['movie_movie_id'];
$screening_time=$_POST['screening_time'];
                      $query="INSERT into screening values"."('$screening_id','$screening_tickets', '$movie_movie_id', '$screening_time')";
                      echo ($query);
                      $result = $conn->query($query);
                      if(!$query) echo ("failed").$conn->error."<br>>";
```

Update User

When the admin clicks the "Edit" button for a user, they are redirected to update_user.php, passing the user_id in the URL.

(Note: This id corresponds to the user whose button is clicked.)

This is done because when we want to display all users in the database, we run an SQL query and use a while loop to iterate through the results.

When we are redirected to update_user.php, the fillUserFormValues() function is executed to automatically populate the values for that particular user.

This is done by retrieving the id from the URL and running an SQL query to find the user with that id. Then, all the fields are automatically filled.

```
// function που γεμτζει τα labels αναλογα με το id που παιρνει το GET

echo"

function fillUserFormValues() {

";

$id = $_GET['id'];

$sql2 = "select * from user having user_id ='$id'";

$result4=$conn->query($sql2);

if(|$result4) die($conn->error);

while($row-$result4--fetch_array(MYSQLI_ASSOC)){

echo "if($tring('$id') === $tring('".$row['user_id']."')}{

document.getElementById('selectUser_username').value = $tring('".$row['user_id']."');

document.getElementById('selectUser_mail').value = $tring('".$row['user_mame']."');

document.getElementById('selectUser_mame').value = $tring('".$row['user_mame']."');

document.getElementById('selectUser_mame').value = $tring('".$row['user_mame']."');

document.getElementById('selectUser_mame').value = $tring('".$row['user_mame']."');

document.getElementById('selectUser_name').value = $tring('".$row['user_name']."');

document.getElementById('selectUser_name').value = $tring('".$row['user_country']."');

document.getElementById('selectUser_country').value = $tring('".$row['user_country']."');

document.getElementById('selectUser_country').value = $tring('".$row['user_country']."');

document.getElementById('selectUser_country').value = $tring('".$row['user_country']."');

document.getElementById('selectUser_address').value = $tring('".$row['user_address']."');

getho "\color="country"."');

getho "\color="country"."'

getho "\color="country"."

getho "\c
```

The role selection for the user is done through a dropdown box.

This way, the admin can select the role for each user.

Delete User

When the admin clicks the delete button, they are redirected to delete_user.php with the id of the user whose button was clicked passed in the URL.

```
284 <db/>
</d>
<br/>
</d>
```

In delete_user.php, to delete the user, reservations made by that user must be deleted first (if this is not done, errors occur because the reservation table has user_user_id as a foreign key). Additionally, when deleting a user, a check is performed to ensure that another admin is not deleted.

```
delete_user.php > ...
      <?php require_once('common.php');</pre>
          session start();
          if (isset($_GET['id'])) {
              $id = $_GET['id'];
              $sql = "DELETE FROM reservation WHERE user_user_id = '$id' ";
              $result = $conn->query($sq1);
              // cannot delete admins roles
              $sql2 = "DELETE FROM user WHERE user_id = '$id' AND user_role<>'Admin'";
              $result2 = $conn->query($sql2);
              if ($result == TRUE) {
16
                  echo "Record deleted successfully.";
              }else{
                  echo "Error:" . $sql . "<br>" . $conn->error;
              header("Location: admin.php");
```

A similar process is followed for deleting screenings and reservations.

Update Movie

When the admin clicks the "Edit" button, they are redirected to update_movie.php with the id of the movie whose button was clicked passed in the URL.

Similarly to before, the details of the specific movie are automatically filled in

Here, the action is set to update movie.php in the same file:

```
<form class='movies' method='post' action='update_movie.php'>
```

When the admin completes the changes and clicks to save them, the code in the head section updates the corresponding record in the database. (Note: Care must be taken not to include an apostrophe 'in any input, as it may interfere with the text.)

```
// Εδω γινεται η αλλαγη στα στοιχεια του χρηστη απο τον admin
if (isset($_POST['movie_id'])&&isset($_POST['movie_name'])&&isset($_POST['movie_director'])&&isset($_POST['movie_id'])&&isset($_POST['movie_director']).**

$ queryUpdateMovie="UPDATE movie SET movie_id-" . $_POST['movie_id'] . "' ,movie_name-" . $_POST['movie_name'] . "' ,movie_director-'" . $_POST['movie_director'] . "' ,movie_name-" . $_POST['movie_name'] . "' ,movie_director-" . $_POST['movie_director'] . "' ,movie_name-" . $_POST['movie_name'] . "' ,movie_director-" . $_POST['movie_director-" . $_POST['movie_director-" . $_POST['movie_name'] . "' ,movie_director-" . $_POST['movie_name']
```

```
sc'] . "' WHERE movie_id='" . $_POST['movie_id'] . "'";
```

Delete Movie

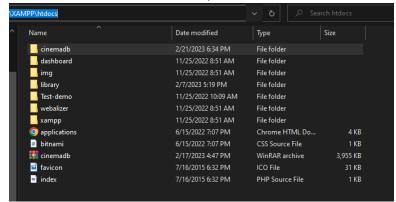

Deleting a movie follows a similar process to deleting a user.

The same applies to Update Reservation, Update Screening, Delete Reservation, Delete Screening, and Create Screening.

Chapter 4: Administrator Manual

The installation instructions are as follows:

1. Take the cinemadb folder and place it in XAMPP\htdocs.

2. Open XAMPP and start Apache and MySQL.

- 3. Go to http://localhost/phpmyadmin/
- 4. Create a new database named "cinemadb".

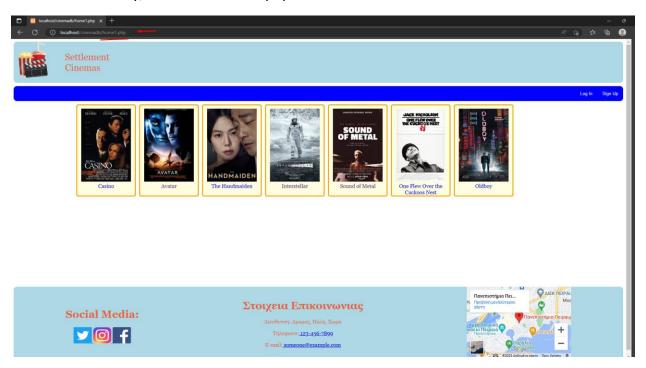

5. Go to "Import" and import the cinemadb.sql file.

6. Enter the URL localhost/cinemadb/home1.php , and you will be directed to home1.php. From here, the system can function normally.

Chapter 5: User Manual

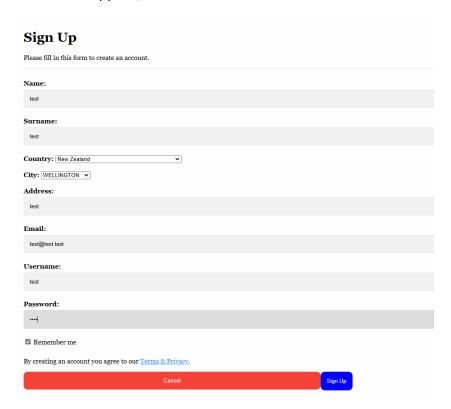

For Users: Initially, we are on home1.php.

Next, a new visitor clicks the "Sign up" button.

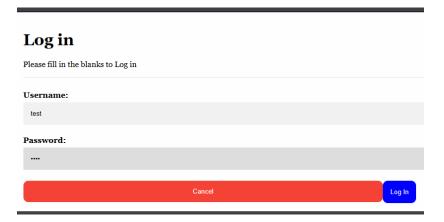

A form will appear, where the visitor fills in their details.

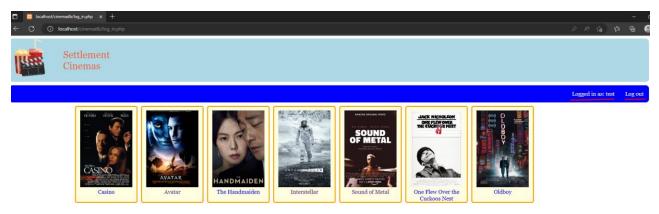

Then, they go back to home1.php and must wait for the admin to approve their request and assign them the role of a User. Until then, they can click on movies to view more information and go back to home1.php by clicking the "Go Back" button.

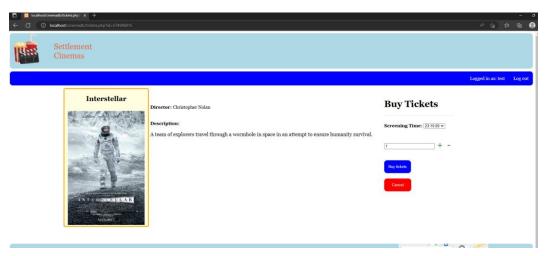

When the admin assigns the User role to the visitor, they can log in and go to log_in.php.

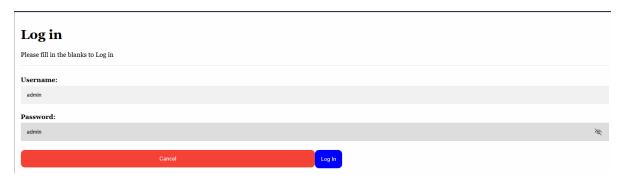

There, they can see the movies and their username displayed as logged in. There is also a "Logout" button to log out and go back to home1.php.

To purchase tickets, the user must click on a movie. This will take them to a page where they can select the number of tickets they want to buy. They also have the option to go back to the home page or log out.

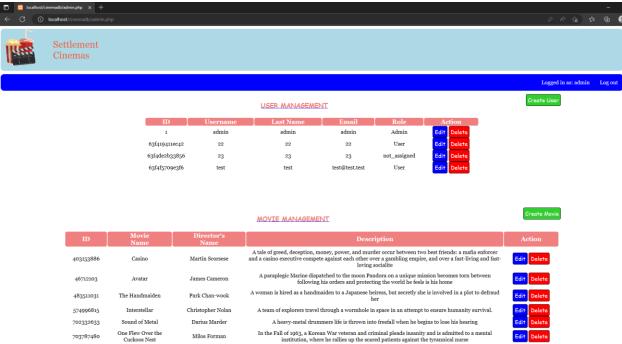

For Administrators: To access the system management page, the admin must log in with the following credentials: Username: admin, Password: admin.

These are the initial admin credentials. If additional users are assigned the role of admin, a user with the Admin role can access the system management page using their own credentials.

In Admin.php, the admin can view all system users, their roles, all movies, all reservations, and all screenings.

From this page, the admin can create new users, movies, and screenings. They can also edit any element in the database from this page by clicking the "Edit" button.
